No. of PhD project: IEDS/2022/IM/02

Title of PhD project: *Mathematical analysis of hydrodynamical models.*

The leading unit: Institute of Mathematics, Polish Academy of Sciences (IM PAN), Warsaw

Requirements:

1. Completed Msc in Mathematics (master's degree) or a related subject (Physics or in Computer Sciences). Knowledge of the subject in frame of analysis of partial differential equations.
2. Knowledge of issues: weak solutions, nonlinear partial differential equations, Sobolev spaces, functional analysis, nonlinear equations, fluid mechanics, collective behaviour.
3. Knowledge of English enabling communication, reading, writing scientific works and cooperation in international community.

Tasks description:

1. Analysis of hydrodynamic systems of partial differential equations in terms of existence of (weak, measure) solutions, their regularity, behaviour for large times, analysis when certain parameters converge to zero or infinity.
2. Processing and analysis of available literature and the latest available publications on the subject of the project.
3. Conducting research in cooperation with foreign teams. Depending on the available funding - study trips, short internships in foreign units.
4. Preparation of scientific articles and conference presentations.
5. Regular reporting of work progress.
6. Assistance in daily scientific and didactic tasks of the unit, including participation in seminars and workshops of the Institute of Mathematics of the Polish Academy of Sciences and the Department of Differential Equations IM PAN.

Abstract:

Within the project we will provide the mathematical analysis of nonlinear Partial Differential Equations (PDEs) and their solutions. In particular, we will concentrate on problems related to fluid mechanics, collective behaviour, interaction of objects/particles with fluid, behaviour of the fluid on domain changing in time. Such phenomena are observed in sciences, technology or nature. Such analysis will give better understanding of some complex behaviours in considered models (systems of equations). The main goal of the project is to show well-posedness of the problem together with qualitative properties of solutions.

Therefore we will try to answer some of the following questions: Are the considered systems possess solutions (strong, weak, measure-valued)? Are they global in time, unique or regular? What is their behaviour for large times? How the whole systems can change when some parameters converge to zero or infinity.

Many phenomena in nature, technology, sociology are described by models seeing it as a flow. However, there is a wide class of phenomena for which the basic Navier-Stokes system is not enough to describe more complex processes. Therefore, there is a need to construct and analyse models that take full account of their character. Here, for example: the Navier-Stokes-Smoluchowsky type systems, generalized Navier-Stokes-Vlasov system, generalized Euler systems can be used.

In particular, in the comprehensive description of many phenomena the challenge is to take into account: collective behaviour and swarming of objects, microstructure associate with particles or objects interaction with fluid which are immersed in, non-Newtonian rheology of the fluid, changes of the shape and volume of the domain, heat effects, different scales of certain parameters which matters in the system are dominant or negligible. The above mentioned phenomena are a source of nonlocal effects, nonlinearities in the system, dependence on domain changes, and may change the character of the system respectively.

The implementation of the project will require the use of advanced methods of the theory of partial differential equation and functional analysis, which the PhD student will learn during the studies. This project can be accomplished in cooperation with scientists from the University of Oxford, the Czech Academy of Sciences in Prague and Imperial College London.

Other information:

1. The work will be carried out under supervision of: dr hab. Aneta Wróblewska-Kamińska, e-mail: awrob@impan.pl, Institute of Mathematics Polish Academy of Sciences in Warsaw.
2. This topic is related to the project: „Mathematical analysis of hydrodynamic models - nonlinearities, non-locality, domain, scales” by National Science Centre Poland within the program Sonata Bis. Involved PhD student will have possibility to apply for an additional scholarship when carrying tasks form the project.
